

SHASHANK H D

Bengaluru, India | +91 9972493394 | hdshashankgowda@gmail.com | [LinkedIn](#) | [Github](#) | hdshashank.dev

Summary

Software engineering graduate with close to a year of internship experience building backend automation in Node.js and full-stack tools with React. Enjoys taking features from idea to production, most recently turning a 5 to 6 hour manual process into an automated one that cut the time by 97%. Looking for a small, fast-moving team where I can collaborate and learn from experienced engineers.

Education

New Horizon College of Engineering

B.E, Information Science and Engineering (GPA: 8.53)

Jul 2026

Bengaluru, Karnataka

Work Experience

Merck | Software Developer Intern

Sep 2025 - Present

- Built an internal bulk-provisioning tool that cut user provisioning time by ~97%, reducing the process from 5-6 manual hours down to under 10 minutes for batches of 400-500 users, by automating bulk creation, role assignment for SAP BTP subaccounts.
- Designed and implemented audit-logging system backed by a SAP HANA database, architecting the schema to capture every bulk action(who, what, when), giving the platform team traceability and accountability that the manual process previously lacked.
- Resolved intermittent batch failures caused by undocumented SCIM API rate limits by implementing concurrent request handling with automatic retry logic, eliminating failed transactions in large-scale provisioning runs without sacrificing throughput.
- Coordinated across multiple platform teams to source distinct authentication credentials for each subaccount, resolving fragmented access management to unify provisioning into a single cross-subaccount tool.
- Built CI/CD pipelines and executed application transports across Dev, QA, and Production for multiple enterprise applications, enabling consistent releases through structured change and release management practices.

Technical Skills

- **Languages:** Python, JavaScript, Typescript, C, SQL
- **Frameworks & Libraries:** Express.js, Next.js, React, Tailwind CSS, Material UI
- **Tools & Data:** REST, JSON, Linux, Git, PostgreSQL, MongoDB

Projects

Fitrack | [Github](#)

- Engineered the core AI personalization engine for FitRack, integrating Google's Gemini API into a Node.js/Express backend with a structured prompt-and-parsing pipeline to generate fully customized workout and nutrition plans across 6+ user-specific variables.
- Resolved inconsistent AI output across atypical user profiles by redesigning prompt logic and adding validation layers, ensuring reliable plan generation for edge cases like injuries, allergies, and unusual fitness goals.
- Built a real-time exercise form-correction system using MediaPipe and OpenCV-based joint-angle tracking in a custom Python pipeline, improving detection accuracy across varied body types and camera angles.
- Delivered a production-grade full-stack application, spanning AI plan generation, BMI/health metric tracking, and daily progress logging, architecting the system end-to-end from database schema to AI integration to UI.

CLI Password Generator | [Github](#)

- Built a CLI password generator using Python and argparse that defaults to a 12-character password, featuring options for custom length, digits, and symbols.
- Worked through argparse's argument-handling and parameter design to build a predictable, usable CLI interface, treating that as the core engineering problem rather than the password logic itself.

URL Shortener | [Github](#)

- Built a URL shortening service using Express.js and EJS, implementing full CRUD operations for creating, managing, and deleting shortened links.
- Added visit tracking on each shortened link to capture usage data, the kind of instrumentation a production redirect service would need.
- Prioritized backend architecture over frontend polish, deepening understanding of server-side rendering with EJS and the full request-to-database flow behind redirect services.

Achievements

- **Smart India Hackathon 2024 | National Finalist Dec 2024:** Led a 6-member team to build Fitrack, an AI-personalized fitness and nutrition platform, ranking in the top 6 of roughly 500 teams (top 1%) on the problem statement; presented and defended the technical solution to a panel of evaluators.
